Demographic Projections for New York State Counties to 2020 A.D.

AVERY ARCHITECTURAL AND FINE ARTS LIBRARY
GIFT OF SEYMOUR B. DURST OLD YORK LIBRARY

The Office of Planning Coordination was formed in 1966 to coordinate all planning that affects New York State—by local, state and federal agencies and by private groups. Its work is carried on through four bureaus:

- The Bureau of Comprehensive Planning prepares long-range goals for the state's development;
- The Bureau of Functional Coordination relates the goals of state and federal agencies to actual programs;
- The Bureau of Planning Research assembles and interprets statistics and projections to help planners;
- The Assistant Director and Counsel oversees technical, legal and financial assistance for local planning.

Planning groups of the state—regional, county, city, town and village—are served through OPC's four offices in the Western, Central, Capital and Metropolitan Districts.

Demographic Projections for New York State Counties to 2020 A.D.

Foreword

This forecast of population is a reprint of the 1968 demographic report by the New York State Office of Planning Coordination. Subsequent forecasts will review these figures and affirm or modify them as developments justify. Many developments already begun or being planned or considered were reviewed; many local planning experts were consulted; many officials in state agencies and local governments were interviewed—all in an attempt to reflect as many of the developmental probabilities as might affect the future and the size of the state's population. To these helpful colleagues, too numerous to list, we express gratitude.

The goal of this work is a common set of figures expressing the most probable future, so that many plans, made by many agencies, for many professional purposes, can be budgeted on a common base. This will permit an easier understanding among agencies, and by the public, of the interactions among programs, even those whose functions are only distantly related. Recreation plans, water resource plans, school plans, housing developments, subdivisions, traffic programs, and many others directly serve overlapping population groups and indirectly serve us all. Their related contributions to our environment may best be understood in the light of the population pattern to be served. It should be understood that we cannot relate every program directly to precise per capita accounting; a dam may provide enough water for thousands when only hundreds need it, because one cannot build a fractional dam. The optimizations of cost and design for some programs require large service increments; other programs (such as water and sewerage development) may require a safety factor of 10 or 20 percent beyond expected maxima. Yet, given these cautions, a general compatibility of analyses may now be achieved.

In all our discussions with local government officials, we asked for cautious, moderate estimates of expected future changes. In some cases we asked them to ignore programs even then on the drawing boards, so as to base the forecasts only on solid and visible evidence. Before the next publication, when these projects have actually begun, their effects will be calculated. Similarly, in successive years, as factories are built or demolished, as new resources are found and developed, as migration demonstrates firm trends, and, even more important, as we find more precise data and better analytic techniques, our projected population figures will be recalculated to show the most reasonable expectations at the time.

A new technique in data processing, developed in this forecast, allowed us to do a great deal of analytical work inexpensively. Yet the greater value in these computer programs is that they express demographic interrelationships in such a way as to permit easy and precise recalculations as new data are fitted into this continuing reevaluation.

To clarify age distributions of the future population, this publication includes age pyramid graphs for each county. These are self-explanatory. Future editions will continue such graphs, and add others as needed.

Demographic Projections was compiled by this office's Bureau of Planning Research. Cornell Aeronautical Laboratory, Inc., of Buffalo was consultant, with Charles B. Motess as project chief. Gratitude for assistance is expressed to many planning consultants.

D. David Brandon, Director
Office of Planning Coordination

August 15, 1969

Technique, Assumptions and Results

The projections in this report were produced by aging each county's 1960 population with survival rates derived from vital statistics for New York State according to sex, economic and ethnic groups, and residence in New York City or the remainder of the state. The projections were made step by step in five-year intervals using data for five-year age groups up to age 84.

For the births in each five-year interval, birth rates were selected, from the U.S. Census Bureau Series,* to be compatible with the recent birth patterns in this state. These figures were corrected by an adjustment factor to produce general fertility rates** in agreement with 1960-1963 trends for each county. The numbers of inmates in institutions, of college students and of military populations were calculated in special ways to minimize the effect of these numbers upon the generated births and the aging of the whole population.

The effects of migration into and out of each county were approximated by considering the 1950-1960 migration patterns by age for each county and by estimating variations within these patterns on the basis of these considerations:

1. Recent trends in population density for towns and counties;
2. Housing and zoning trends, such as the proportion of housing units in multiple units;
3. Proximity to highly urbanized areas and main transportation routes;
4. The recent growth trends of metropolitan areas, including corrections to projected migration rates to remove the effects of large migrations unique to a portion of the 1950-1960 decade;
5. The 1960-1965 migration was altered in some cases where special censuses or estimates by the Bureau of the Census were available for county population for 1965.

* **Current Population Report Series P-25, No. 286** of the U. S. Bureau of Census.

** General fertility rate is defined as the number of live births in a five-year period, per 1,000 women aged 15-49 at start of the five-year period.

Summary of General Assumptions

In making population projections certain assumptions must be made regarding such basic variables as birth and death rates and economic and other environmental conditions. Judgment projections, like those in this report, are based upon the single set of assumptions which appears most probable in the light of detailed analysis.

It was assumed that no major events would occur to increase or decrease substantially the birth, death and migration rates from current trends. Disastrous wars, widespread epidemics and similar catastrophes were precluded.

The birth rates, to follow the trend of the Census Series D rates,* were based on the assumption that fertility will drop below the high levels of the 1950s but will be above the Depression low of 1934-1936.

The migration of college students to places of residence across county lines was approximated from census data and from the State Education Department's records. The migration of young men into the armed services was not considered separately from the normally high migration of young men in general.

Summary of Results

Projections of the population of each county, OPC Development Region and SMSA in New York State are tabulated for five-year intervals from

1960 to 2020. The primary reason for forecasting so far ahead is to provide a common estimating base for regional planning and for public works developments which deal with long futures. The assumptions justifying these extended projections derive from those supporting the shorter-term projections. As events justify changes in the prior assumptions, future annual population publications will also reflect the related changes in long-term assumptions.

These projections are presented for five-year age groups for males and females and for the total population, arranged alphabetically by the county or regional name. Also presented is the number of net migrants, including college student migrants, who entered (+) or left (−) the county or region during the preceding five-year interval.

For economy in tabular computation, these projections are rounded only in the summaries. This should not, of course, be interpreted as projections of population pretending to unit accuracy, and it is suggested that persons using these projections round off figures to the nearest 1,000.

Summary population projections (rounded to the nearest 1,000) are presented in three tables following this introduction. These tables show census figures for total population in 1950 and 1960, and projections at five-year intervals from 1965 through 2020.

Table 1 summarizes these totals by county and for the state as a whole. A map shows the counties of the state.

Table 2 summarizes these totals by OPC region and for the state as a whole. These totals are also graphed, and a map shows the OPC regions and districts.

Table 3 summarizes these totals by Standard Metropolitan Statistical Area and for the state as a whole. A map shows SMSAs in New York State.
